WHAT IS "BITCOIN HALVING"??

Bitcoin halving is a preprogrammed event that reduces the rate at which new Bitcoins are created, happening approximately every four years.

HOW DOES IT WORK?

Every 210,000 blocks mined, the reward miners receive for validating transactions is cut in half.

WHY DOES IT MATTER?

Scarcity: Halving reduces the rate at which new Bitcoins enter circulation, increasing scarcity and potentially driving up value.

HISTORICAL IMPACT

Previous halvings have historically been followed by significant price increases, attracting attention from investors and traders.

LONG-TERM IMPLICATIONS

The final Bitcoin will be mined around 2140 when the reward becomes minuscule, making it extremely scarce.

*time for
plan* 

**BITCOIN IS
BETTER THAN
YOU THINK!**

Bitcoin makes it possible to really own your money!

In the past, our money was backed by gold reserves so that it was limited and retained its value. This has no longer been the case since 1971.

Nowadays, banks simply create new money out of nothing. This is not possible with Bitcoin.

Bitcoin is the only digital asset that is really scarce.

Bitcoin is the largest and most secure computer network in the world and it requires energy to secure and protect it from manipulation.

The more people use Bitcoin, the greater the value per unit becomes, while the price fluctuates less and less.

Inflation is worse than you think!

Prices are rising wherever you look, goods and services become more expensive, but your wages can't keep up...*But why is that?*

If the money supply is increased (through "rescue packages", government debt, etc.), the money saved loses purchasing power.

Creating new monetary units does not create wealth.

Money that can be created without effort is not scarce and is called "soft money".

Due to the Cantillon effect, printing new "soft money" widens the gap between rich and poor.

6 REASONS WHY BITCOIN HAS VALUE

SCARCE

There will be only < 21 million Bitcoin to ever exist

TRANSPARENT

You can verify where your Bitcoin came from and where it goes

DECENTRALIZED

Its core code and info are stored on multiple servers in the world

FREEDOM

BTC can't be controlled by any government, bank or company

FUNGIBLE

Bitcoin is perfectly interchangeable

BORDERLESS

Bitcoin can be sent worldwide in no time
